### **ABSTRACT**

This work is an endeavour to contemplate a valueadded conductive plastic composite material derived as recycled plastic depending on Polyethylene (PP)/carbon black. We choose to add Carbon black (CB) as a filler material in order to enhance the electrical conductivity as well as other properties associated with the composite. Solution mixing method was adopted to develop this composite where the consequences of CB loadings on various parameters like processability, morphology and thermal stability of the composites were examined. Electrical conductivity increased with the increasing amount of the CB loading. The clearly perceived better filler-matrix interaction and filler dispersion were observed in images obtained from Scanning Electron Microscope (SEM). These are the underlying reason behind the improved electrical, thermal, sensing and dielectric properties of the prepared plastic composite material.

## **Film fabrication**

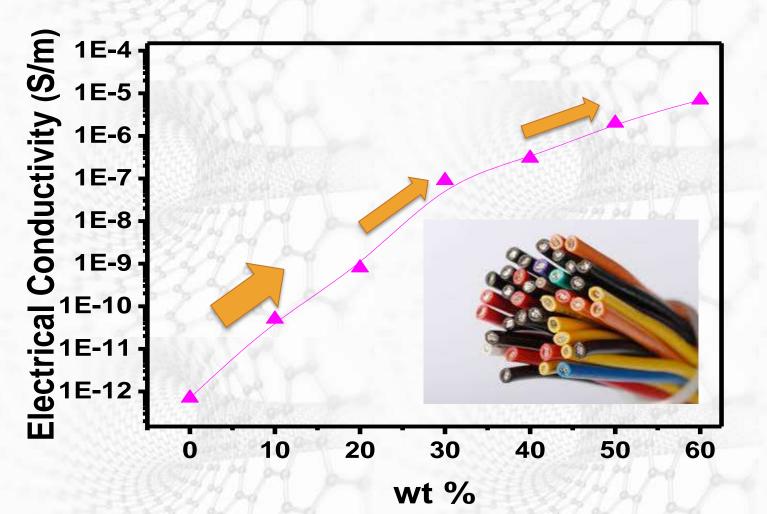

Ultrasonication (2 hrs) method to disperse the carbon black powder the solvent in a homogeneous way

The 24 hrs magnetic stirrer to disperse the plastic perfectly with the carbon black powder.

## **Electrical studies**

## **INTRODUCTION**

- □ Nowadays, plastic is the main material that people depend on worldwide.
- □ It is nearly used in every item that is manufactured in the world.
- □ However, misusing these materials could lead to serious environment issues.
- □ This table illustrates the waste per person that is being produced everyday in different countries.

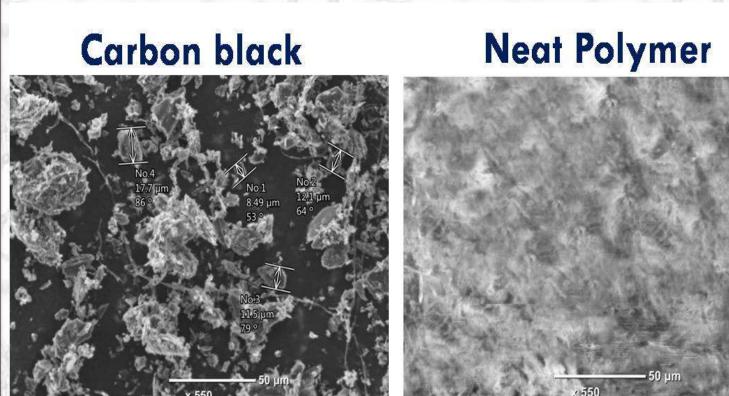

Prepared homogeneous solution was poured in a petri dish and dried for 24 hrs using vacuum oven

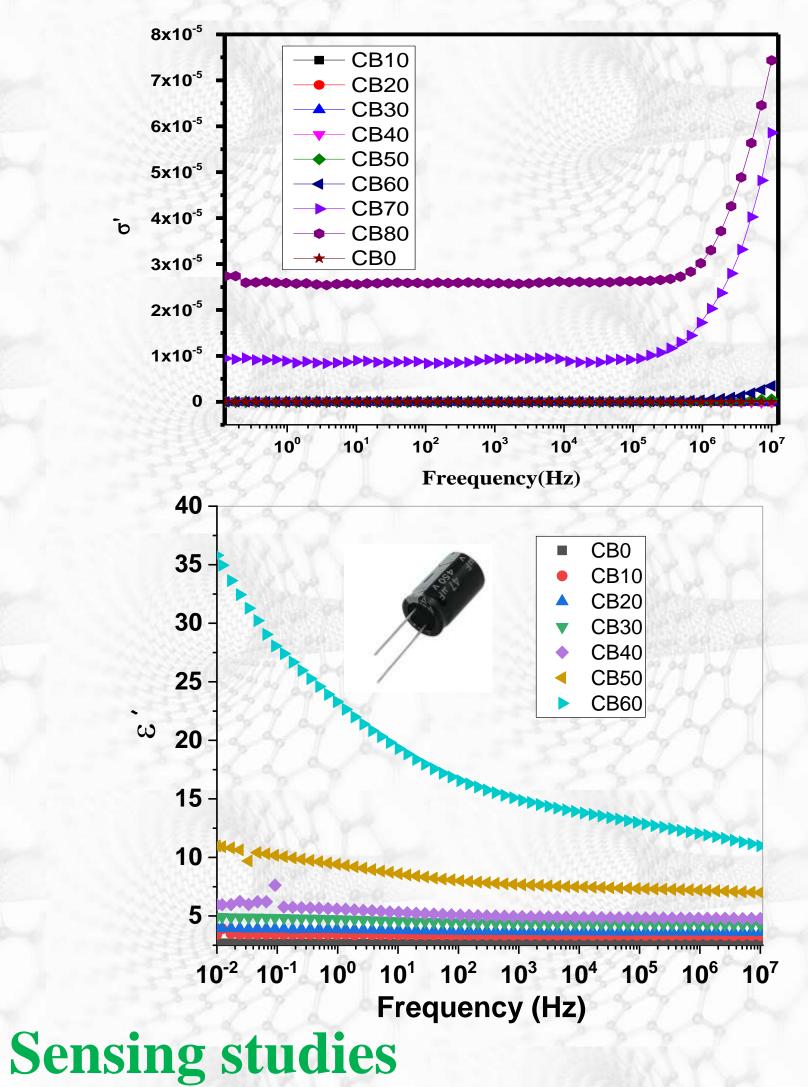

The final film was peeled off and cut in to the appropriate size.

Composite

## **RESULTS & DISCUSSION Morphological studies**

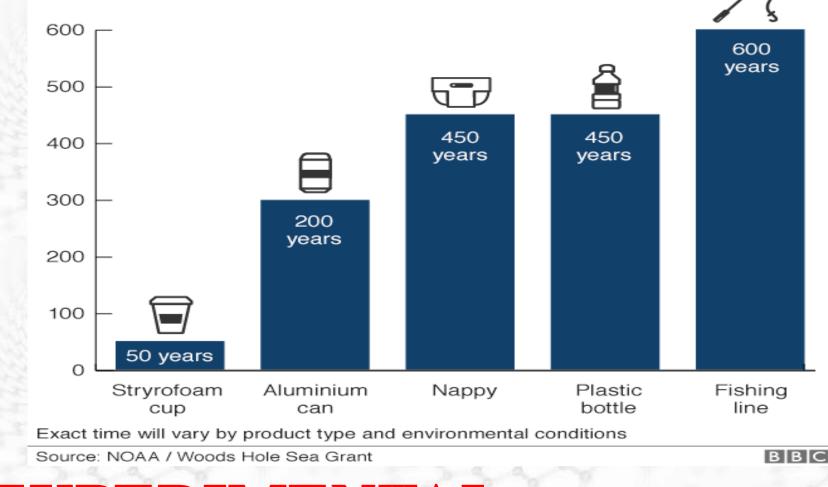

### **Dielectric studies**

#### • As a result, we need a solution to reduce this waste?????.

How long til they're gone? Estimated time taken to biodegrade

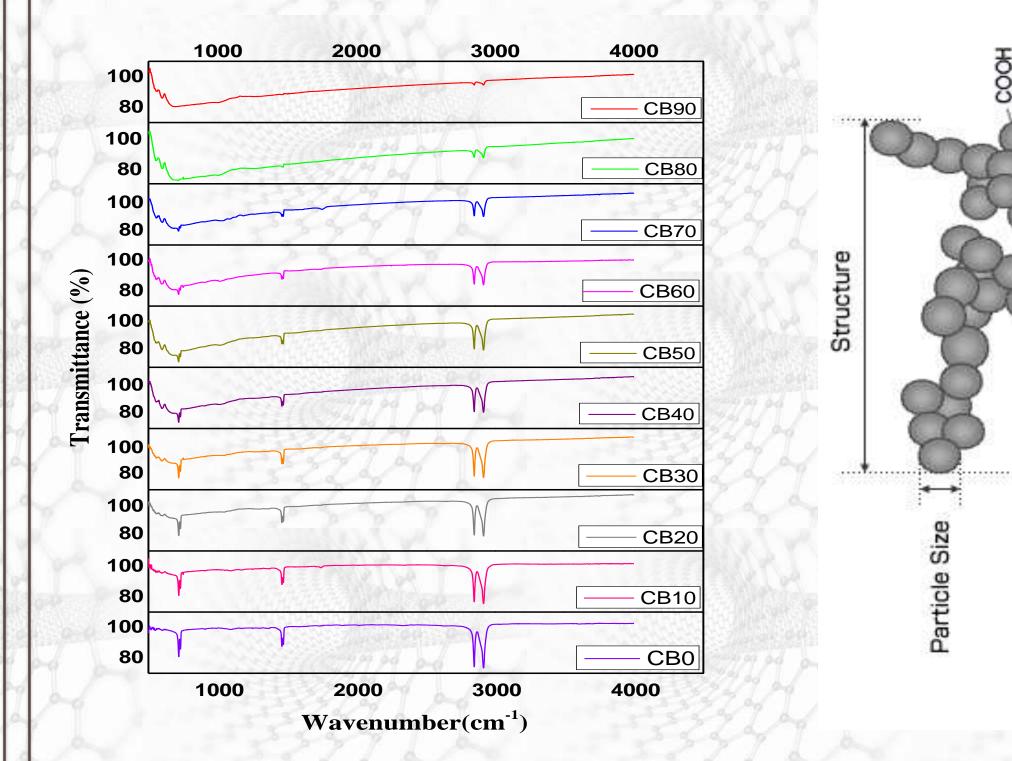

Plastic waste

Waste from Qatar aluminium company (carbon black)

## **FTIR analysis**

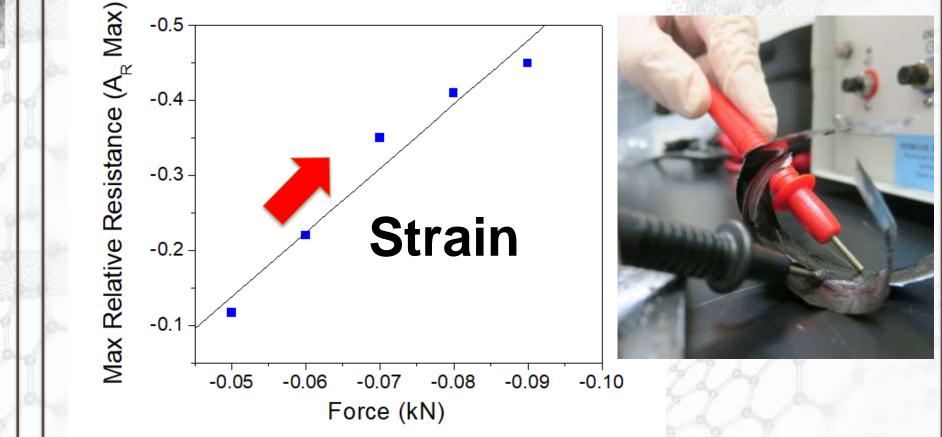

### **Thermal studies**

•TGA curves of CB filled PP/ blends and it represents upon loading the CB the thermal stability of the

polymer

significantly.

## **BENEFITS TO QATAR**

The state of art technologies currently involved for separating the plastic wastes, processing, analyzing its properties and designing the valueadded products have many associated issues, and at the same time the generated waste generation is not reducing effectively to great extents as needed. It is thus, significant to local research capacity in the strategic area of polymer waste recycling in a country especially like the one Qatar's where, economy is concerned.

### **CONCLUSION**

• The carbon black particles are uniformly

The plastic bottle (HPDE) was cut into small pieces and dissolve in solvent (Toluene)

Ultrasonication to disperse the carbon black in the solvent (toluene).

prepared composite in different wt% filler (carbon black)
